

Conduto — Meeting Summary

September 18th

<https://www.conduto.com/>

1. Company / Context

- Conduto operates across multiple countries, including Ecuador, Peru and Brazil.
- Their core business is focused mainly on **pipeline construction and civil works for oil pipelines**.
- They manage a significant amount of project-related information.
- The IT structure includes **support, infrastructure, and development**, with Oscar leading the technology function in Ecuador.
- Oscar also has contact with IT teams in Brazil and Peru and participates in some corporate initiatives.

2. Current Situation

- They currently use **Microsoft Dynamics GP** as their ERP, but are evaluating a migration to either **SAP or Dynamics 365** because GP is approaching end of support.
- They **do not currently have a dedicated project-control software**.
- Project control exists as a process, but it is handled mainly through **Excel and pivot tables**.
- Their historical/project data is spread across different formats and sources, including **Excel, Project and PDFs**.
- They have been evaluating the ERP change for more than a year, but the decision has not yet been finalized.

3. Problems / Potential Opportunities

Main identified gap:

- Lack of a centralized system/process for project control and global information management.

Potential opportunity areas:

- Consolidating project information from different sources.
- Making historical project data more usable.
- Extracting insights from large volumes of project data.
- Supporting analysis around **project profitability**.

- Potentially using AI to structure, query and analyze information currently distributed across Excel, Project and PDF files.

4. Oscar's Mindset

Oscar is **Head of Technology at Conduto** and appears genuinely open to exploring external expertise.

His mindset seems to be:

- They recognize that they have a large amount of project information but have not yet developed a strong global information-management approach.
- They are interested in **leveraging an experienced external company** to help with this.
- He wants to see **real examples/results and methodology**, rather than a generic AI pitch.
- He specifically asked what Zenthic has already achieved with similar construction/infrastructure projects and what inputs/data would be required.
- He sees a potential opportunity at the **group level**, depending on what Zenthic can demonstrate.
- He is not the sole decision-maker. Pedro Hansen, General Manager in Ecuador, is already aware of the opportunity and expressed interest.

5. Next Steps

1. **Zenthic:** Review the information from the meeting with the technical team.
2. Identify the **most relevant case study** based on Conduto's situation, ideally related to construction/project information, data consolidation, project analysis or profitability.
3. Prepare a **more tailored second meeting/demo**, rather than a generic presentation.
4. Oscar will communicate the opportunity to **Pedro Hansen** and potentially bring him into the next meeting.
5. Include additional IT/decision-making stakeholders where relevant.
6. In the second meeting, validate the use case in more detail and determine whether there is enough value to move into a deeper **audit/discovery phase**.

Key takeaway

The opportunity is **not yet "AI automation" in the traditional sense**.

The strongest angle emerging from the meeting is:

Large volume of fragmented project data → limited centralized project control → opportunity to structure, consolidate and extract business intelligence from existing data.

The next meeting should therefore focus on **showing a relevant proof/case and understanding the business impact**, not simply presenting Zenthic's capabilities.
